The present sequence represents an insulin-like polypeptide (pro-ILP). The protein is expressed in the colon and uterus, and is a member of the insulin/IGF family. The immature pro-ILP comprises a 135 amino acid sequence, which is processed into the mature form which comprises pro-ILP exists as a separate peptide after processing of pro-ILP. The neurophysiological function affecting fluid homeostasis, electrolyte homeostasis, cardiovascular function, blood pressure, somatic or cardiac indictopic activity, cardiac chrontople activity and collagen deposition. The methods can be used for diagnosing a physiologic or pathologic condition of the uterus, colon or other ILP-expressing cell or tissue and for diagnosis and therapeutics.
                                                                                                                                                           Insulin-like polypeptide; pro-ILP; ILP; insulin/IGF family; A chain; B chain; C chain; neurophysiological function; fluid homeostasis; electrolyte homeostasis; cardiovascular function; blood pressure; somatic; cardiac ionotropic activity; cardiac chronotropic activity; collagen deposition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Colon and uterus expressed insulin-like polypeptide, useful in the treatment of disorders related to neurophysiological function
                                                                                  Pro-insulin-like peptide (pro-ILP).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Claim 5; Fig 6B; 75pp; English.

Ashkenazi AJ, Goddard A, Gurney AL, Klein RD, Napier MA, Wood WI; PRO211, PRO228, PRO538, PRO172 and PRO182 polypeptides useful for treating tumors including cancers of the breast and lung, leukeamia and for identifying compounds capable of inhibiting WPI; 2000-638201/61. N-PSDB; AAA54109 Yuan J;

Claim 31; Fig 10; 133pp; English. growth of neoplastic cells

Isolated PRO211, PRO228, PRO538, PRO172 or PRO182 polypeptides

Cor their agonists (preferably anti-PRO agonist antibody or a small
molecule minicking the biological activity of PRO polypeptide) are
useful in vitro or in vivo for inhibiting the growth of a tumour cell.
Compositions comprising the PRO polypeptides are useful for
inhibiting neoplastic cell growth and for treating cancer including
breast, ovarian, renal, colorectal, uterine, prostate, lung, bladder,
central nervous system cancer, melanoma and leukemia in a mammal.
The PRO polypeptides are also useful for treating other disorders
central nervous, gill, astrocytal, hypothalamic and other glandular,
and neuronal, gilal, astrocytal, hypothalamic and other glandular,
inflammatory, anglogenic and immunologic disorders and
inflammatory, anglogenic and immunologic disorders as well as being
cosful for identifying agonists to PRO polypeptides by contacting the
colypeptide with a candidate molecule and monitoring biological

nucleic acids and the proteins they encode may be used in the prevention, treatment and diagnosis of diseases associated with inappropriate PRO expression such as cardiovascular, endothelial or angiogenic disorders in mammals (e.g. atherosolerosis, cancers and cardiac hypertrophy). For example, the nucleic acids (NCs) and vectors containing them and the PRO polypeptide may be used to treat disorders associated with decreased PRO expression. AAA77510 to AAAA7721 and AAB24388 to AAB24435 represent nucleotide and protein sequences used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present sequence is that of zins3, a novel member of the insulin/relaxin family. The zins3 gene maps to human chromosome 1p31, a region that is correlated to a heritable form of non-insulin dependent diabetes mellitus (NIDDM). zins3 mRNA is not expressed

in detectable amnounts in healthy tissue, indicating that the zins3

Specialized cell type. zins3 polynucleotides and polypeptides can
be used to diagnose disorders associated with abnormal expression

of the zins3 protein, and to identify polymorphisms that result

from mutations in the zins3 gene. In particular, the invention

provides methods for identifying abnormalities in expression that

are a factor in causing, or predisposing, a person to some defect

in glucose metabolism, such as NIDDM. Processing of the mature

c zins3 protein involves cleavage at the C-terminus of the signal

peptide and, based on predicted structural homology with other

members of the insulin family, cleavage at the C-terminus of the

B-chain and at the N-terminus of the A-chain, resulting in
removal of the C-peptide. Cysteine residues at positions 29 and 41

(B-chain) and 121 and 135 (A-chain) are capable of associating

through cysteine bridges and forming disulfide-bonded molecules. \$5555555555555555x 8

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

-!- FUNCTION: MAY HAVE A ROLE IN GUT CONTRACTILITY OR IN THYMIC
DEVELOPMENT AND REGULATION.
-!- SUBUNIT: HETERODIMER OF A B CHAIN AND AN A CHAIN LINKED BY TWO
DISULFIDE BONDS (BY SIMILARITY).
-!- TISSUE SPECIFICITY: HIGHEST EXPRESSION IN COLON WITH LOWER LEVELS
IN THYMUS. MIMIMAL LEVELS IN TESTIS.
-!- SIMILARITY: BELONGS TO THE INSULIN/IGF/RELAXIN FAMILY.

1. FUNCTION: MAY HAVE A ROLE IN SPERM DEVELOPMENT AND FERTILIZATION.

1. SUBCELLUIAR LOCATION: Secreted (By similarity).

1. TISSUE SPECIFICITY: TESTIS-SPECIFIC.

1. SIMILARITY: BELONGS TO THE INSULIN/IGF/RELAXIN FAMILY.

"Cloning of two novel mammalian paralogs of relaxin/insulin family proteins and their expression in testis and kidney."; Mol. Endocrinol. 13:2163-2174(1999).

-!- SUBCELLULAR LOCATION: Type I membrane protein.
-!- ALTERNATIVE PRODUCTS: 6 ISONEMS; 1 (SHOWN HERE), 2, 3, 4, 5 AND 6; ARE PRODUCED BY ALTERNATIVE SPLICING.
-!- TISSUE SPECIFICITY: ALMOST EXCLUSIVELY EXPRESSED IN THE NERVOUS SYSTEM. PREDOMINANTLY EXPRESSED IN NEURONS.
-!- SIMILARITY: CONTAINS 1 SAM DOMAIN.
-!- SIMILARITY: CONTAINS 2 FIBRONECTIN TYPE III-LIKE DOMAINS.
-!- SIMILARITY: BELONGS TO THE TYR FAMILY OF PROTEIN KINASES. EPHRIN
                                                                                                                     Lassmann H., Steck A.J.;
Lassmann H., Steck A.J.;
Lassmann H., Steck A.J.;
Lastression and developmental regulation of Ehk-1, a neuronal
Elk-like receptor tyrosine kinase in brain.";
Neuroscience 63:163-178(1994).
-!- FUNCTION: RECEPTOR FOR MEMBERS OF THE EPHRIN-A FAMILY. BINDS TO
EPHRIN-A1, -A2, -A3, -A4 AND -A5.
-!- CATALITIC ACTIVITY: ATP + a protein tyrosine = ADP + protein
                                                                     WEDLINE-95206467; PubMed-7898646;

The invention relates to an isolated insulin homologue zinst having chomology to the relaxin family. The zinst gene, located on chromosome homology to the relaxin family. The zinst gene, located on chromosome 19p13.11, encodes a 142 amino acid protein, where the Linst polyperlide comprises a B chain and A chain comprising amino acid residues 26.52 and comprises a B chain and A chain comprising amino acid residues 26.52 and 119-142 respectively, joined by inter- and intra-chain disulfide bonds. Cinst has cytostatic, antifertility and vasotropic activity. Zinst protein is an animals and in therapies for treating resisted reproductive disorders. Zinst protein is useful in treating reproductive, comprise to kits activity. Zinst protein is useful in treating reproductive, combinators of its activity. Zinst polypeptides and modulators of the cinhibitors of its activity. Zinst polypeptides and modulators of the compression of its activity. Zinst polypeptides and modulators of the compression of compression conditions in overy. Poetcetion of zinst functions including patchlogical conditions in overy. Poetcetion of zinst polypeptides in the serum or tissue biopsy of a patient is useful for diagnosing ovarian cancer. The molecules are also useful for treating dysfunction associated with contractile tissues or to suppress or enhance contractility in vitro fertilization, control, treating importace or other male reproductive dysfunction, inducing birth, for promoting growth, differentiation, development and/or maturation of ovarian cells, myocytes, endothelial cells, osteoblasts in colluctive and in the study of the ovarian oyle, reproductive directions and fertilization. The polypeptide is also useful as a modulator of blood pressure, muscle tension and osmotic cuseful as a modulator of blood pressure, muscle tension and osmotic
                                                                                                                                                                                                                                                                                                                                                                            New insulin homologue polypeptide having homology to relaxin family, designated zins4 and zins4 polynucleotide, useful for diagnosing, preventing, treating reproductive, prostate, heart and kidney disorders
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Claim 6; Page 72-73; 79pp; English.

AAR AAR95999-R96006 represent the asymmetry sequences of target binding assemblies (TBA) of the invention. The TBA is recognised by the target binding region (TBR) of a probe of the invention. The probe of the total binding region (TBR) of a probe of the invention. The probe of the invention contains at TBR, a booster binding region (BBR), and an optional support or attachment (OSA). The TBA contains at least one uncleic acid recognition unit (NAR), and optionally a linker sequence, an asymmetry sequence, an unclear localisation signal ascenbly sequence, and an OSA. The assembly sequence and asymmetry sequences are responsible for the folding and association of the NARs. The NARs are responsible for the folding and association of the NARs. The NARs are responsible for the folding and association of the Dahllomavirus (HPV) LTR and Tat binding units. The LINKer sequence is an oligopeptide, which does not interfere with NAR inter sequence is an oligopeptide, which does not interfere with NAR function, but provides stability and control over the spacing of the NAR interfere means of localisation of the probe. The probe can be used in a method for detecting or localising a specific target nucleic acid containing systems, including bacteria and viruses.
                                                                                                                                                                                                                                                                                   Target binding assembly; nucleic acid recognition unit; NF-kappa-B; SP1; TATA; human papillomavirus; HPV; HPV E2; human immunodeficiency virus; HIV LTR; Tat binding unit; probe; assembly sequence; asymmetry sequence; nuclear localisation signal sequence; human cell; HPV LTR; HIV; bacteria;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Probe nucleic acids, target binding assemblies, etc - for detection and localisation of specific nucleic acid sequences, esp. HIV and

             The present sequence represents insulin-like polypeptide (pro-ILP)
chain B peptide. The ILP protein is expressed in the colon and uterus,
and is a member of the insulin/IGF family. The immature pro-ILP
comprises a 135 amino acid sequence, which is processed into the mature
comprises a 135 amino acid sequence, which is processed into the mature
form which comprises an A chain and a B chain linked by disulfide bonds.
The C-peptide of pro-ILP saists as a separate peptide after processing
of pro-ILP. The ILP protein is useful in treatment of disorders related
to neurophysiological function affecting fluid homeostasis, electrolyte
concortais, cardiavosacular function, blood pressure, somatic or cardiac
homeostasis, cardiavosacular function, blood pressure, somatic or cardiac
lonotropic activity, cardiac chronorropic activity and collagen
conficien of the uterus, colon or other ILP-expressing cell
or tissue and for diagnosis and screening of modulators and therapeutics.

The process of the color of appear in the specification; it was
                                                                                                                                                                                                                                                          Insulin-like polypeptide; pro-ILD; ILD; insulin/IGF family; A chain; B chain; C chain; neurophysiological function; fluid homeostasis; electrolyte homeostasis; cardiovascular function; blood pressure; somatic; cardiac ionotropic activity; cardiac chronotropic activity; collagen deposition.

Identifying mutations in human chromosome 1p31, preferably a zins3 gene mutation, comprises using an insulin/relaxin family member (designated zins3), useful for diagnosing non-insulin dependent diabetes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present sequence is that of a peptide from the B chain of human zin3 (see AAY9570). The peptide was used to immunize guinea Pigs, rabbits and chickens to generate antibodies for zins3, which were used in assays to determine the tissue distribution and cell expression of zins3. Zins3 is a novel member of the insulin/relaxin family whose gene maps to a region of human chromosome ip associated with non-insulin dependent diabetes mellitus (NIDDM). Zins3 polynuclectides and polypeptides can be used to diagnose disorders associated with abnormal expression of zins3 and to identify polymorphisms that result from mutations in the zins3 gene. The invention provides methods for identifying abnormalities in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       expression that are a factor in causing, or predisposing, a person to some defect in glucose metabolism, such as NIDDM.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      δλ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                   The Zins3 protein is an insulin homologue protein. Polynucleotide molecules taken from its gene can be introduced into a cultured cell using an expression vector. The cell will express an insulin homologue polypeptide encoded by the polynucleotide. The polypeptides can also be expressed by introducing the polynucleotides into the germline of a nonhuman animal. The polypeptides can be used to identify and isolate receptors for zins3. Antibodies and antagonists of the polypeptides can be used for treating disease associated with extracellular matrix and vessels. The antibodies may also be used in the diagnosis of diseases associated with the polypeptide, such as reproductive diseases associated with the placenta and uterus, gastrointestinal diseases, and placental and colon pathology. Antagonists against the polypeptide may also be used to treat diseases such as preclampsia, premature labour, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Insulin-like polypeptide; pro-ILP; ILP; insulin/IGF family; A chain; B chain; C chain; neurophysiological function; fluid homeostasis; electrolyte homeostasis; cardiovascular function; blood pressure; somatic; cardiac ionotropic activity; cardiac chronotropic activity; collagen deposition.

The present sequence represents an insulin-like polypeptide (pro-ILP). The protein is expressed in the colon and uterus, and is a member of the insulin/IGF family. The immature pro-ILP comprises a 135 amino acid sequence, which is processed into the mature form which comprises an A chain and a B chain linked by disulfide bonds. The C-peptide of pro-ILP exists as a separate peptide after processing of pro-ILP. The ILP protein is useful in treatment of disorders related to neurophysiological function affecting fluid homeostasis, electrolyte homeostasis, cardiovascular function, blood pressure, somatic or cardiac homotropic activity, cardiac chronotropic activity and collagen deposition. The methods can be used for diagnosing a physiologic or pathologic condition of the uterus, colon or other ILP-expressing cell or tissue and for diagnosis and screening of modulators and therapeutics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps

Isolated PRO211, PRO228, PRO538, PRO172 or PRO182 polypeptides

or their agonists (preferably anti-PRO agonist antibody or a small
molecule minicking the biological activity of PRO polypeptide) are
useful in vitro or in vivo for inhibiting the growth of a tumour cell.

Compositions comprising the PRO polypeptides are useful for
inhibiting neoplastic cell growth and for treating cancer including
breast, ovarian, renal, colorectal, uterine, prostate, lung, bladder,
central nervous system cancer, melanoma and leukemia in a mammal.
The PRO POLYPeptides are also useful for treating other disorders
such as neuronal, glial, astrocytal, hypothalamic and other glandular,
inflammatory, anglogenic and immunologic disorders and
inflammatory, anglogenic and immunologic disorders as well as being
useful for identifying agonists to PRO polypeptides by contacting the
polypeptide with a candidate molecule and monitoring biological
                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Ashkenazi AJ, Goddard A, Gurney AL, Klein RD, Napier MA, Wood WI;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    PRO211, PRO228, PRO538, PRO172 and PRO182 polypeptides useful for treating tumors including cancers of the breast and lung, leukeamia and for identifying compounds capable of inhibiting growth of neoplastic cells

useful for preventing, diagnosing and treating diagnosing a cardiovascular, endothelial or angiogenic disorder in mammals by modulating cell proliferation, angiogenesis and cardiovascularisation, and for identifying agonists and antagonists of these processes. The nucleic acids and the proteins they encode may be used in the prevention, treatment and diagnosis of diseases associated with inappropriate PRO expression such as cardiovascular, endothelial or angiogenic disorders in mammals (e.g. atherosclerosis, cancers and cardiac hypertrophy). For example, the nucleic acids (NCs) and vectors containing them and the PRO polypeptide may be used to treat disorders associated with decreased PRO expression. AAA77510 to AAA77721 and AAB24388 to AAB2435 represent nucleotide and protein sequences used in the exemplification of the present invention.

135 AA;

Sequence

The present invention describes nucleic acids encoding PRO polypeptides

The zins3 gene maps to human chromosome insulin/relaxin family. The zins3 gene maps to human chromosome pall, a region that is correlated to a heritable form of non-insulin dependent diabetes mellitus (NIDDM). zins3 mRNA is not expressed in detectable amnounts in healthy tissue, indicating that the zins3 copynucleotide is a candidate marker for a disease state and/or a specialized cell type. zins3 polynucleotides and polypeptides can be used to diagnose disorders associated with abnormal expression of the zins3 protein, and to identify polymorphisms that result from mutations in the zins3 gene. In particular, the invention provides methods for identifying abnormalities in expression that are a factor in causing, or predisposing, a person to some defect in quicose metabolism, such as NIDDM. Processing of the mature zins3 protein involves cleavage at the C-terminus of the signal peptide and, based on predicted structural homology with other
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Identifying mutations in human chromosome 1p31, preferably a zins3 gene mutation, comprises using an insulin/relaxin family member (designated zins3), useful for diagnosing non-insulin dependent diabetes

members of the insulin family, cleavage at the C-terminus of the B-chain and at the N-terminus of the A-chain, resulting in removal of the C-peptide. Cysteine residues at positions 29 and 41 (B-chain) and 121 and 135 (A-chain) are capable of associating through cysteine bridges and forming disulfide-bonded molecules.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                proteins from a variety of organisms, including human, dog, cat, horse, cow, pig, hamster, monkey, macaque, yeast, bacteria, fruit fly, sea urchin and tomator. These were derived from expressed sequence tags (ESTs) from the organism of interest. They can be used in diagnostics, forensics, gene mapping, identification of mutations, to assess biodiversity and for nutritional purposes. The present sequence is a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention provides the protein and coding sequences of novel
             Composition for inhibiting neoplastic cell growth and treating cancers of ovary, uterus, prostate, lung and bladder, comprises PRO211, PRO228, PRO538, PRO172 or PRO182 polypeptide or their agonist
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Isolated polypeptide for treatment of diseases, diagnostics, raising antibodies and research use -
                                                                                                                                polypeptide or their agonists, mixed with a carrier is useful for inhibiting neoplastic growth and treating tumnors such as cancers of breast, ovary, renal, colorectal, uterus, prostate, lung, bladder, central nervous system, melanoma and leukaemia.
                                                                                                             Compositions comprising a PRO211, PRO228, PRO538, PRO172 or PRO182
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; sheep; pig; cow; fruit fly; yeast; hamster; macaque; horse; tomato; monkey; dog; sea urchin; expressed sequence tag; EST; diagnostics; forensic test; gene mapping; genetic disorder; biodiversity; gene therapy; nutrition.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Zhou P, Qian XB, Wang Z, Chen R, Asundi V;

AAU12172-AAU12446 represent novel human secretory and transmembrane PRO polypeptides. The PRO polypeptides are useful to detect other PRO polypeptides, to link bioactive molecules to cells expressing PRO polypeptides, to modulate biological activities of cells expressing PRO polypeptides, and to detect the presence of mammalian lung, colon, breast, prostate, rectal, cervical or liver tumours by comparing PRO polypeptide expression in a cell sample to that in a control sample. Some of the 275 sequences are also useful to stimulate the release of tumour necrosis factor-alpha (TNF-alpha) from human blood, the proliferation or differentiation of chondrocytes, the proliferation or gene expression in pericyte cells, the release of proteoglycans from cartlage, the proliferation of inner ear unficular supporting cells or of T-lymphocytes, the release of a cytokine from peripheral blood monocytes (PBMCs), or the proliferation of endothelial cells Some of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                                                                                                                                                                                                                                                                                                                    the PRO polypeptides may modulate glucose or free fatty acid uptake by skelteral muscle cells or by adipocytes, or inhibit binding of A-peptide to factor VITA. The PRO polypeptides can be used in assays to identify molecules involved in binding interactions. The polynucleotides encoding
        Isolated, secretory and transmembrane PRO polypeptide used to detect other PRO polypeptides, link bioactive molecules to cells expressing PRO polypeptides, and detect the presence of mammallan tumours e.g.

The present sequence is that of PRO182 (UNQ156), a novel human continuous protein encoded by cDNA (see AAF30052) isolated immunomodulator protein encoded by cDNA (see AAF30052) isolated from a uterine cDNA library. The invention provides Polynucleotides (see AAF30050-62) encoding novel human PRO proteins (see AAB20108-20) including PRO182. Claimed composition of inflammatory cells into a tissue of a mammal, stimulating or enhancing an immune cesponse in a mammal, or increasing the proliferation of T-lymphocytes in a mammal in response to an antigon. Claimed compositions comprising the PRO polypeptide or its antagonist have the opposite of effect. A claimed method for treating an immune related disorder, involves administating the PRO polypeptide, comprising the PRO polypeptide or its antagonist have the opposite or selected from systemic lupus erythematosus, rheumatoid arthritis, consist antibody or an antagonist antibody. The disorder is selected from systemic lupus erythematosus, rheumatoid arthritis, costeoarthritis, juvenile chronic arthritis, spoodyloarthropathy, systemic vasculitis, sarcoldosis, autoimmune haemologic of systemic vasculitis, sarcoldosis, autoimmune haemologic autoimmune heamboy, pagentis, selecteds multiple sclerosis, autoimmune chromboytopeania, thyroiditis, diabetes mellitus, inflammatory bowel disease (uncommune colitis and cornin antiple sclerosis), autoimmune chromboytopeania, thyroiditis, diabetes mellitus, billiary cirrhosis, granulomatous hepatitis, sclerosing cholangitis, billiary cirrhosis, granulomatous hepatitis, sclerosing cholangitis, altoimmune mediated skeases (such as bullous skin disease, (auto)immune mediated cornin and graft-vascus colated diseases (such as graft rejection and graft-vascus-host disease, cirther as graft rejection and graft-vascus-host disease, cirther and compound capable of inhibiting the expression of the PRO polypeptide, vectors, host cells and compound capable of inhibiting the arression or the level of expression of the PRO sponsitivity of the PRO 
                                                                                                                                                                                                                                                                                                              Godowski PJ, Gurney AL;

WPI; 2001-090793/10. N-PSDB; AAC97396 New isolated nucleic acid for producing a PRO polypeptide, analyzing genetic disorders and treating cardiovascular, endothelial or anglogenic disorders, such as atherosclerosis, wounds or cancer -

Claim 69; Fig 18; 293pp; English.

The invention relates to novel human angiogenesis-associated proteins designated PRO proteins (AAB53064-B53097), and to nucleic acids encoding PRO proteins. The invention also relates to vectors and host cells comprising a PRO nucleic acid, the recombinant production of a PRO protein, PRO antibodies specific for a PRO protein, fusion proteins compounds which inhibit the expression of a PRO gene. The invention additionally encompasses methods of identifying modulators of PRO expression or activity; diagnosting a cardiovascular, endothelial or additionally encompasses methods of identifying modulators of PRO expression or activity diagnosting a cardiovascular, endothelial or mutations in a PRO gene, or the expression level of a PRO gene within a particular tissue; treating a cardiovascular, endothelial or angiogenic disorder via the administration of a PRO protein, PRO nucleic acid, or PRO agonist or antagonist; a retroviral gene therapy vector comprising a

Relaxin-like factor - useful as replacement for relaxin in treatment

```
PRO nucleic acid; and methods of inhibiting or stimulating endothelial cell growth, cardiac hypertrophy or PRO-induced angiogenesis via the administration of a PRO protein, or an agonist or antigonist thereof. PRO nucleic acids, PRO proteins, antibodies against PRO proteins, PRO agonists and PRO antagonists may be used as therapeutic agents to treat cardiovascular, endothelial or angiogenic disorders, such as thereosclerosis, osteoporosis, myocardial infarction, hypertension, diabetic retinopathy, rheumatoid arthritis, Crohn's disease, psoriasis, endometriosis, ulcers, wounds, cancer, Alzheimer's disease, Huntington's disease, or stroke. PRO nucleic acids are additionally useful in the recombinant production of PRO proteins, as hybridisation probes to screen libraries to isolate cDNAs with sequence identity to PRO proteins, to analyse genetic disorders, and in gene therapy. PRO nucleic acids can also be used to produce transgenic animals useful for the development and screening of potential invention.
                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                                                                                                                                                                                                                                                                 Gaps

The sequences given in AAW07862-63 represent the A and B chains of relaxin-like factor (RLF). RLF displaces bound relaxin tracer from the receptor to which it is bound. The RLF can be used to treat relaxin treatable conditions, esp. cardiovascular disease, neurodegenerative or neurological disease, sinus bradycardia, depression, hair loss or diseases related to uncontrolled or abnormal formation of collagen (e.g. scleroderma) or fibronectin. RLF can be radiolabelled for use in binding assays, and for relaxin receptor mapping. RLF shares primary and secondary homology to relaxin and insulin.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

-!- ALTERNATIVE PRODUCTS: 2 isoforms; 1 (shown here) and 2; are produced by alternative splicing.
-!- TISSUE SPECIFICITY: Expressed in the ovary during pregnancy. Also expressed in placenta, decidua and prostate.
-!- SIMILARITY: BELONGS TO THE INSULIN/IGF/RELAXIN FAMILY.
J. Mol. Biol. 221:15-21(1991).

-!- FUNCTION: RELAXIN IS AN OVARIAN HORMONE THAT ACTS WITH ESTROGEN PRODUCE DILATATION OF THE BIRTH CANAL IN MANY MAMALE. MAY BE INVOLVED IN REMODELING OF CONNECTIVE TISSUES DURING PREGNANCY.

PROMOTING GROWTH OF PUBIC LIGAMENTS AND RIPENING OF THE CERVIX.

-!- SUBUNIT: HETERODIMER OF A B CHAIN AND AN A CHAIN LINKED BY TWO
